Automatic Power Switch

Advantages of the offered APS automation systems:

One proposal in many versions matching different requirements

- Enables the use of circuit breakers or disconnectors of the entire General Electric devices family of the Record Plus series, EntelliGuard * G, EntelliGuard G, EntelliGuard L in any configuration
- Implemented load shedding functions using circuit breakers, disconnectors and contactors
- Classic manual control using buttons included in the synoptics or control from a touchscreen terminal
- Option to choose assembly variant
 - » Classic system of connectors or version of an automation board with quick-swivel couplings, giving big time savings during replacement or upgrading of a working installation
- Choice of data access route, parameters recorded in APS and work visualization
 - » Operator terminal
 - » MODBUS RTU RS485 communication as standard
 - » Optional MODBUS ETHERNET TCP IP
 - » Optional secure remote access to data in the cloud
 - » Optional remote predictive diagnostics

High quality, proven design, technical support

- Components of reputable companies
- Quality control based on a full functional test of the set of switches and the automation system
- 18-months-warranty and after sales service
- Technical support during commissioning and staff training
- APS design reliability tested on over 750 working applications installed over the last 15 years on hundreds of facilities, including hospitals, airports, IT centers, office buildings, etc.

Control, prediction, security, reduction of power interruptions

- Standard – quality control of power supply parameters (presence of phases, consistency of spin direction, voltage control in the adjustable tolerance range)
- Standard – reading of all events handled by APS and creating an archive saved to memory (last 2000 events)
- Standard – reading events on the operator terminal and in the form of an Excel file to be downloaded to a USB stick
- Standard – APS automation equipped with active and passive interlocks, allowing to replace a mechanical interlock
- Standard – a safe control algorithm that prevents connecting sources to shorted circuits
- Standard – software with the function of APS automation parameter matching that limits power outages in unstable power grids
- Standard – APS parameterization and selection of program variants from the operator terminal

The projects currently being developed for systems of power supply applied in:

- **infrastructure:** airports, ports, railway stations, radar control systems, treatment plants, water supply;
- **public utilities:** hospitals, IT centers, office buildings, shopping centers, sports facilities;
- **industrial:** refineries, glass works, steel works, continuous production lines, etc.,

it must met high demands regarding reliability, transparency, simplicity in operation and maintenance, energy supply interruptions prevention, flexibility and ease of access to basic and critical data of the power supply system.

The joint project of **AB-MICRO** and **Meller Electric Automation** implements these requirements in the offered **Innovative Automatic Power Switch** series of solutions.

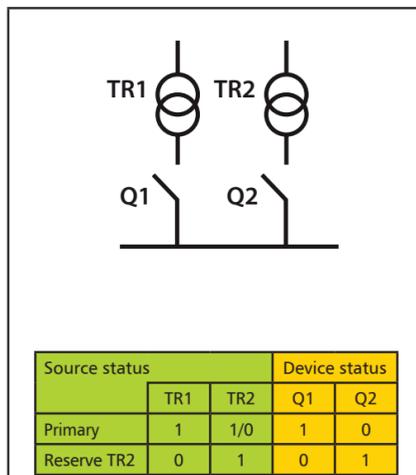

Based on many years of experience and hundreds of completed projects operating in industrial facilities, infrastructure and public utilities, these companies offer **Automatic Power Switch**, i.e., the power switching solutions for systems with two, three or four power sources.

Description of symbols in logic table

Q1, Q2, Q3, Q12, Q23 – circuit breakers, disconnectors
 QZ1, QZ2, QZ3 – circuit breaker, disconnector, contactor
 TR1, TR2 – transformer
 G – generator
 1 – voltage present, device closed
 0 – no voltage, device open
 1/OK – status configuration from the operator terminal
 1/0 – voltage is either present or absent

All APS (AUTOMATIC POWER SWITCH) systems are equipped with a RS485 communication port with MODBUS transmission protocol enabling the visualization of the system operation.

Choice of system version with ETHERNET MODBUS TCP/IP communication by selecting the APS type with the TE letters at the end of the reference.

As standard, all APS automation systems are equipped with MAGELIS touchscreen terminal (3.7") for local visualization – marked with the letter T in the reference code.

It is possible to order the APS automation system with a bigger touchscreen terminal (5.7", 7" or 10.4" screen diagonal) – if you choose such non-standard device, please specify the type of terminal you want to order.

In the case of non-standard needs for the implementation of customized APS automation systems, please contact your sales representative or contact us at +48 510 508 821.

EntelliGuard* G - air circuit breakers

The EntelliGuard* range of power circuit breakers encompasses a line of three and four pole air circuit breakers with nominal currents ranging from 400 to 6400Amp in four basic frames.

High strength, comprehensive possibilities

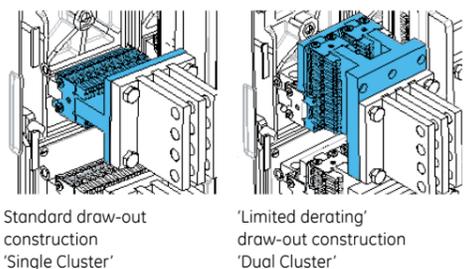

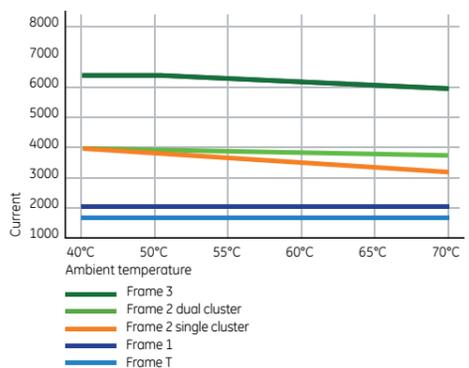

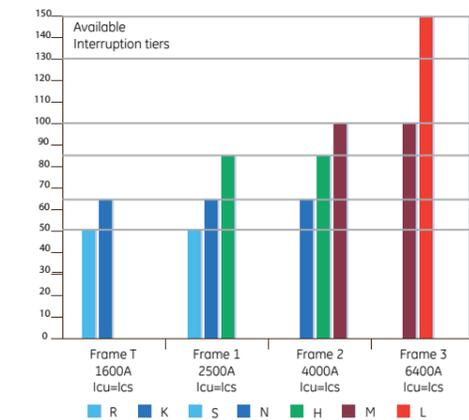

EntelliGuard* G circuit breakers are a new series of air circuit breakers that have been developed based on existing M-PACT and ME07 families. They offer a really global platform that meets IEC, ANSI and UL standards. The breakers are available in the range of 400 ÷ 6400 A in three housings, with disconnection parameters for short-circuit current up to 150 kA. Their design provides a unique combination of high short-circuit current immunity with quick disconnection and selectivity.

The circuit breaker includes the most innovative EntelliGuard* G power trigger, which adds the latest technical solutions in the field of system security, reliability, measurement, relays and communication using Modbus or Profibus protocols. It is available in four basic versions E, S, N and H. Each of them has the same mechanical design including a screen with an ammeter.

Selective and fast

EntelliGuard* circuit breakers combine the high speed shutdown of huge short-circuit currents in about 40 milliseconds or less while maintaining selectivity.

In the event of short-circuit, the circuit breaker design allows it to be kept closed for a short period of time. The time the circuit breaker stays closed results from the user-selected setting if the current value does not exceed the range of quick short-circuit protection OR is equal to 15 milliseconds if the short-circuit current reaches the value of the immediate short-circuit protection. Immediate protection system can be programmed in such a way that under normal conditions it waits for operating of the circuit breaker on the receiving side.

No compromise ... Reliable

The breakers are designed to provide the user with years of safe and reliable operation by combining high electrical and mechanical strength, market-leading thermal parameters when built into an array or device, and allowing a lot of space for connecting incoming and outgoing rail wires and cables. Making connections is possible either from the front or from the back. Regardless of the number of poles, rated current or rated disconnection parameters, each of the two configurations has the same height, depth and dimensions of circuit breakers.

EntelliGuard* circuit breakers has been designed as a modern 'Power Circuit Breaker' without neglecting GE's heritage of more than 50 years in building air circuit breakers.

These power circuit breakers uncompromisingly combine the properties of the older M-PACT Plus 1 and 2, ME07 and Wavepro lines with modern state of the art technology.

The result: a device that with a proven electrical and mechanical life span independent of its operation mode: be it manual, electrical or by means of the installed shunt and/or undervoltage releases.

Uncompromising ... Safety

In order to protect service personnel against the hazards of short circuits whilst working on a power distribution system EntelliGuard power circuit breakers can be equipped with a so called RELT switch input. This allows the breaker to be switched to its lowest short-circuit settings on service, thus limiting the hazards concerned.

The RELT switch input (with feedback) is available on the breaker auxiliary terminals or can be accessed through the communication bus.

State of the art electronic trip unit

All EntelliGuard power circuit breakers are equipped with a digital electronic trip unit, available in four basic versions: E, S, N and H. Each has a common design that comes with a screen providing an ammeter and allowing a simple and accurate menu-driven adjustment of the breaker parameters across a broad current range.

All functionality is menu-driven accessed by using 4 setting and one enter key thus allowing a fast and accurate setting of the device. The user can set the device to an automatic or manual reset after a fault.

Main adjustment possibilities

- LT – LTD overload protection
- ST – STD timed short-circuit protection
- I instantaneous short-circuit protection
- LT – B and LT – C protection options (thermomagnetic characteristics)
- LT – F protection options (fuse features)
- RELT protection options (short-circuit protection temporary reduced)
- GF protection options (ground fault "differential" or "return")
- EF security options (UEF, REF, and SEF)
- Signaling and protection functions
- Measurement, control and communication functions

APS-2T1S-OMW1-2S

PS-1T1G1S (retrofit synoptic board)

APS-2T1G2Z-MW2-3S-T

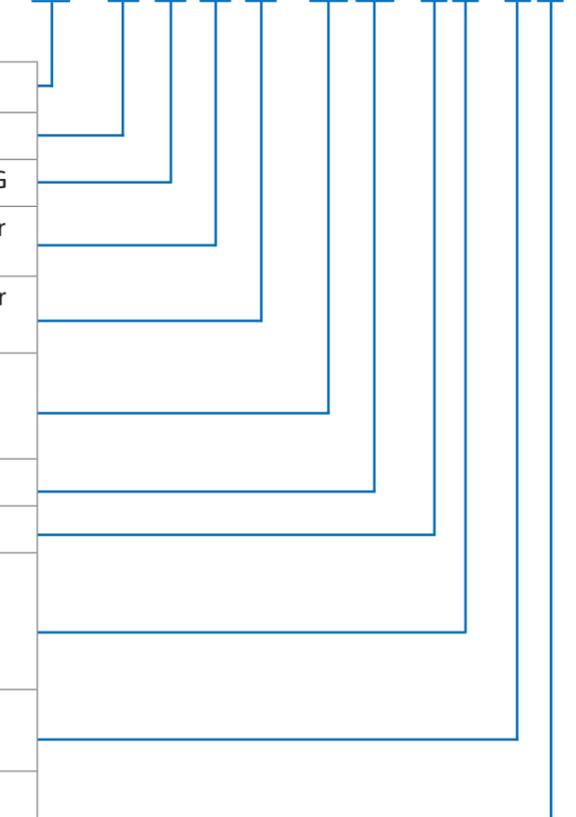

Name coding rules of the automatic reserve switching of APS type

In this catalog, a description in the form of a code is used. It contains a number of information enabling the selection of the APS version corresponding to the design requirements.

The following is a description and meaning of the individual components forming the code describing in details the version of the various APS automation systems listed in the catalog.

Automatic Power Switch	
Number of transformer sources	1T, 2T or 3T
Number of generator sources	no description, 1G or 2G
Number of clutches	no description, 1S, 2S or 4S
Number of power dump devices	no description, 1Z, 2Z or 3Z
Manufacturing type: (plug connectors plus synoptic plate)	classic connectors - OM plug connectors - M retrofit version - R
Software version	W1, W2 or W3
Logic table version	0,1,2,3,4,5
Version of the synoptic:	no synoptic - 0 synoptic elements (loose) - S assembled synoptic plate (retrofit) - R
Optional equipment: touch screen HMI terminal	- T
Optional equipment: Ethernet Modbus TCP/IP communication	- E

APS - 2T 1G 1S 2Z - OM W2 - 0 S - T E

Example:

APS - 2T1S - OMW1 - 2S - T

Automation system supporting power supply from two transformer sources separated by a clutch.

It is equipped with classic connectors, with program of the W1 version, logic table 2, elements for making the synoptic panel and a touchscreen operator terminal.

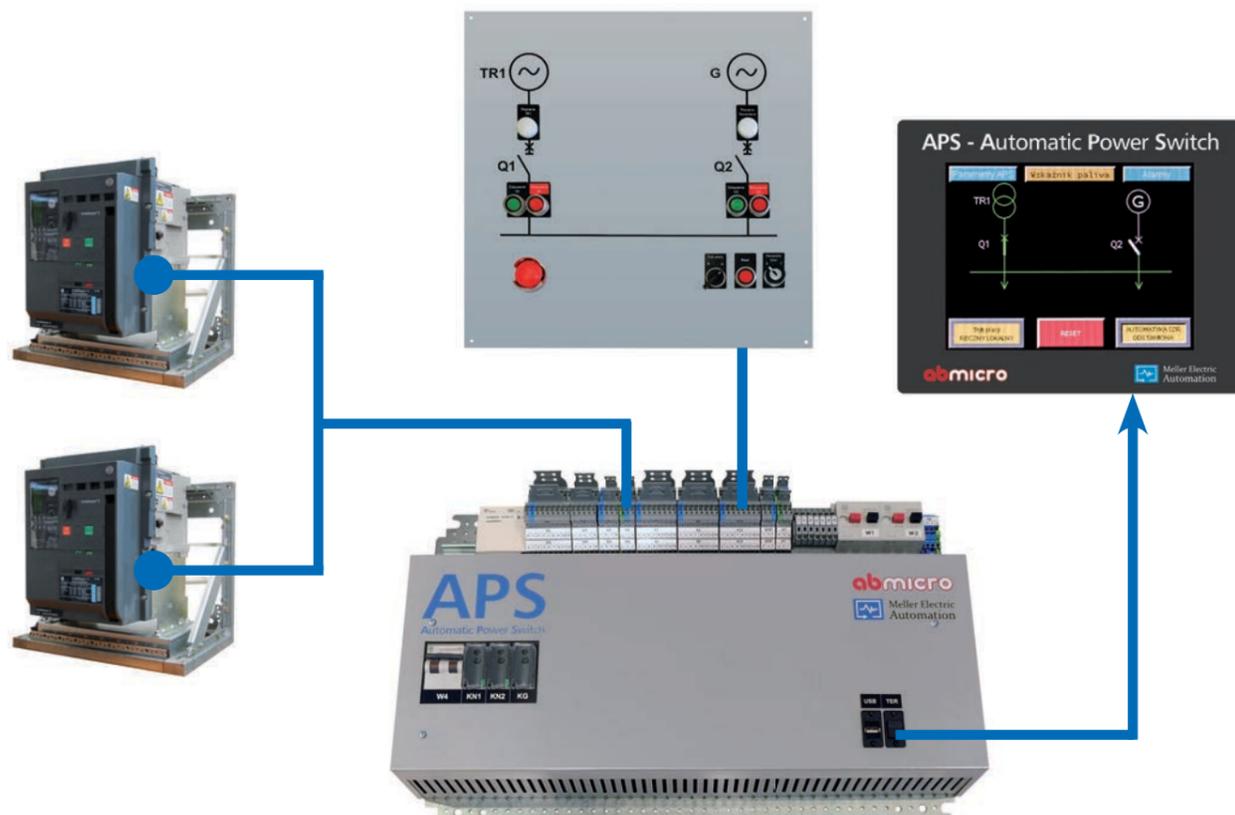

APS RETROFIT APU and DS for APENY circuit breakers

To extend the life of switchboards, GE offers a unique solution to replace the old type air circuit breaker APU or DS with a modern one that meets all modern requirements, i.e. an EntelliGuard circuit breaker. Our APS RETROFIT modernization set will ensure a reliable and cost-decreasing solution, allowing many years of work with a minimum number of shutdowns

AB-MICRO company has prepared APS RETROFIT automation sets that contains the following:

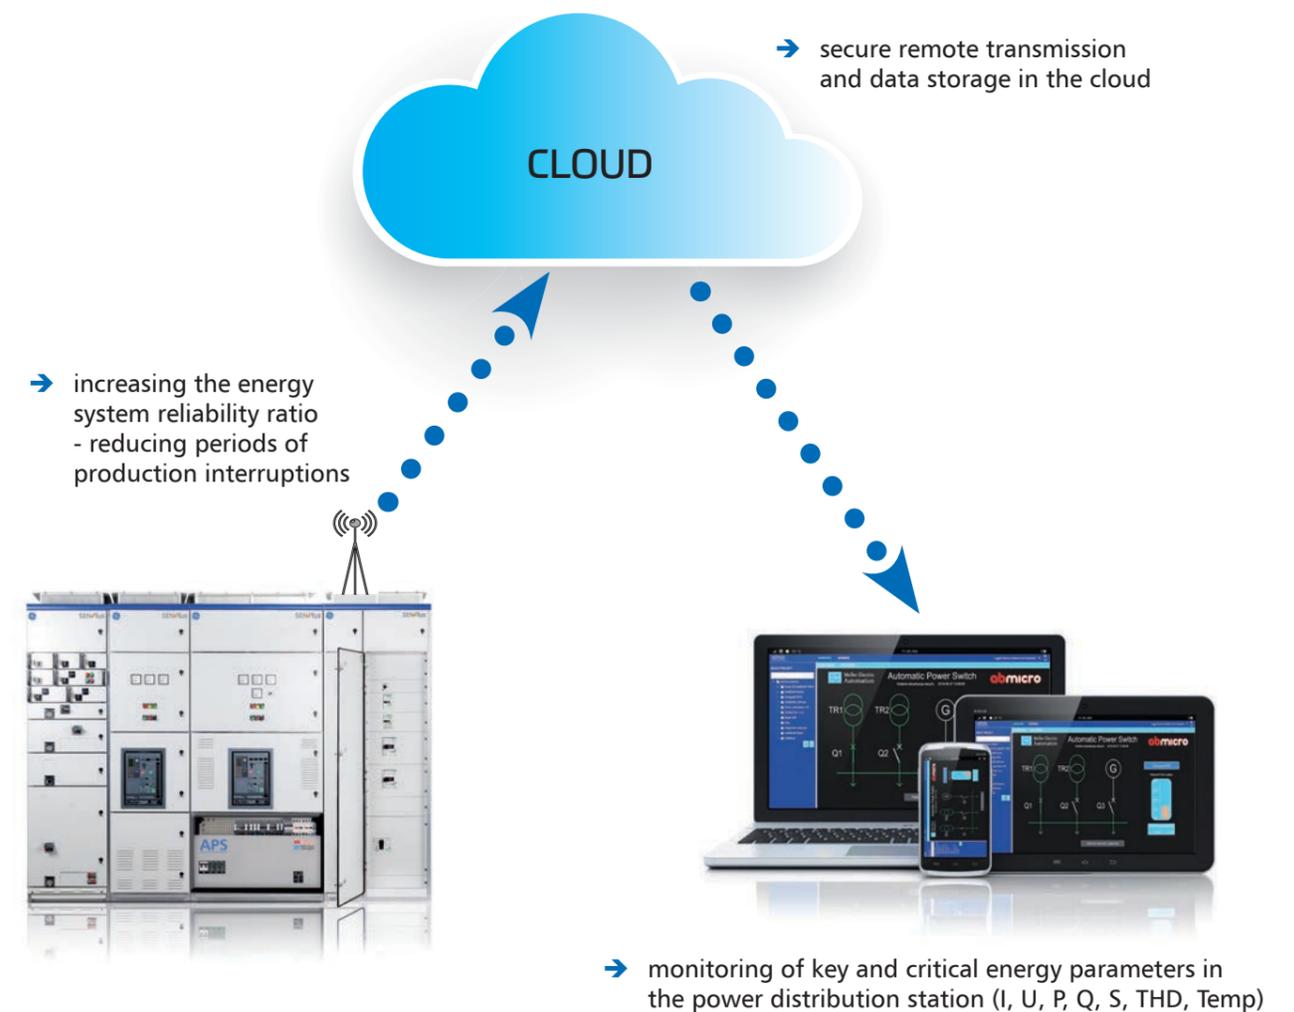

- EntelliGuard circuit breakers in the RETROFIT version
- Automation board equipped with plug connectors
- Assembled synoptic board equipped with wires with plug connectors for APS
- Operator terminal as an option to be installed or loaned for APS parameterization

Such a set enables fast and efficient assembly of automation, without wasting valuable time necessary for labor-intensive works of replacing power apparatus during modernization of the switchgear. In facilities where even short-term power outages are a huge difficulty disorganizing the functioning and work of an enterprise, the time to complete modernization is crucial. There are cases when modernization is possible only once a year during few hours. A carefully thoughtful modernization plan, the use of proven solutions and components allowing the efficient, quick assembly and launching give the chance of final success. The modular design of APS gives the opportunity to choose the equipment and available functionalities needed by the user. This allows to optimize the equipment and price of the proposed solution to the customer expectations.

Monitoring and access to the basic and critical data of the energy system

- the information provided allows for making decisions and advance actions necessary to prevent failures, prevent energy system collapses and possible modernizations that lead to savings and reduce the costs of operating the facility's power supply system

Combination of the APS benefits and processing algorithms as well as the secure data transfer technologies

- Higher security level
- SMS notification program in the form of short and important information about the control system status as well as the power supply system of the facility
- Using of the processing prediction algorithm and presentation of the data so to assess the power supply quality in a simple and transparent way as well as the appropriate operation of the power supply system of the monitored object
